

## **Enhanced Security Everywhere**

#### Welcome to the next generation of security.

Todays's SD-WAN technology provides a faster, more reliable network with flexible redundancy options to ensure your users are always able to connect to your business-critical applications. All while providing more visibility, easier management and enhanced security in or out of the office.

### **Improve Performance**

Prioritize business-critical traffic and realtime services like (VoIP) steering it over the most efficient route for increased efficiency and business continuity.

#### **Reduce Costs**

Leverage lower cost Internet access for redundancy, increased bandwidth and replace multiple point systems for a unified solution to connect locations, secure your network and manage your users.

#### **Boosts Security**

Cloud based or edge integrated security features prevent data loss, downtime, regulatory violations, & legal liabilities for all users whether in office, mobile or at home.

### **Make Security Stronger**

Present a unified front against threats with better protection and multiple layers of security deployed exactly how and where you want it.

### Middle-Mile Optimization

Avoid unpredictable behavior of the Internet by leveraging private, global, network options built on top of multiple SLA-backed tier-1 carriers.

### **Simplify Management**

Increases your team efficiency by making it easier to integrate, orchestrate, maintain, monitor, and manage your cloud security solutions from one centralized hub.

## UCaaS and Cloud Service Access Optimization

Guarantee voice quality and minimize latency by intelligently routing UCaaS traffic to the nearest point of presence (PoP) closest to the UCaaS instance anywhere across the globe.

# Instantly Deploy Everywhere

Instead of deploying cybersecurity solutions manually to individual offices, branches or users, easily deploy next gen technology from the cloud to thousands of users in minutes.
